- 1 Which of the following equations has an enthalpy change equal to the negative lattice enthalpy for potassium chloride?
- A  $\text{KCl}_{(s)} \rightarrow \text{K}_{(g)} + \frac{1}{2}\text{Cl}_{2(g)}$       B  $\text{KCl}_{(s)} \rightarrow \text{K}^+_{(g)} + \text{Cl}^-_{(g)}$   
 C  $\text{KCl}_{(g)} \rightarrow \text{K}^+_{(g)} + \text{Cl}^-_{(g)}$       D  $\text{KCl}_{(aq)} \rightarrow \text{K}^+_{(g)} + \text{Cl}^-_{(g)}$
- 2 The enthalpy change for the process represented by the equation  $\text{Na}_{(s)} \rightarrow \text{Na}^+_{(g)} + e^-$  is equal to
- A the first ionisation energy of sodium  
 B the sum of the electron affinity and the enthalpy change of atomisation of sodium  
 C the sum of the first ionisation energy and the electron affinity of sodium  
 D the sum of the first ionisation energy and the enthalpy change of atomisation of sodium.
- 3 Which one of the reactions listed below represents the electron affinity of chlorine?
- A  $\text{Cl}_{(g)} \rightarrow \text{Cl}^+_{(g)} + e^-$       B  $\text{Cl}^+_{(g)} + e^- \rightarrow \text{Cl}_{(g)}$   
 C  $\text{Cl}_{(g)} + e^- \rightarrow \text{Cl}^-_{(g)}$       D  $\frac{1}{2}\text{Cl}_{2(g)} + e^- \rightarrow \text{Cl}^-_{(g)}$
- 4 Which of the following equations correctly represents the standard enthalpy change of atomisation of oxygen gas?
- A  $\text{O}_{2(g)} \rightarrow 2\text{O}_{(g)}$       B  $\text{O}_{2(g)} \rightarrow \text{O}^+_{(g)} + \text{O}^-_{(g)}$   
 C  $\frac{1}{2}\text{O}_{2(g)} \rightarrow \text{O}_{(g)}$       D  $\text{O}_3 \rightarrow 3\text{O}_{(g)}$
- 5 For which one of the following is  $\Delta H^\ominus$  of the reaction numerically equal to the lattice energy of ammonium chloride?
- A  $\frac{1}{2}\text{N}_{2(g)} + 2\text{H}_{2(g)} + \frac{1}{2}\text{Cl}_{2(g)} \rightarrow \text{NH}_4\text{Cl}_{(s)}$       B  $\text{NH}_4^+_{(g)} + \text{Cl}^-_{(g)} \rightarrow \text{NH}_4\text{Cl}_{(s)}$   
 C  $\text{NH}_4\text{Cl}_{(s)} \rightarrow \text{N}^{3-}_{(g)} + 4\text{H}^+_{(g)} + \text{Cl}^-_{(g)}$       D  $\text{NH}_4\text{Cl}_{(g)} \rightarrow \text{NH}_4\text{Cl}_{(s)}$
- 6 Which of the following classes of reaction always have an endothermic enthalpy change?
- I atomisation      II ionisation      III solution
- A I only      B II only      C III only      D I and II only
- 7 Which of the following would lead to more exothermic lattice energies?
- I Higher charges on ions      II Larger sizes of ion
- A I only      B II only      C Both I and II      D Neither I nor II
- 8 Which one of the following has the most exothermic crystal lattice enthalpy?
- A NaF      B CsI      C  $\text{MgF}_2$       D  $\text{MgCl}_2$
- 9 The lattice energies (enthalpies) of rubidium fluoride ( $\text{RbF}$ ) and caesium chloride ( $\text{CsCl}$ ) are  $-760 \text{ kJ mol}^{-1}$  and  $-650 \text{ kJ mol}^{-1}$  respectively. What is the lattice energy of caesium fluoride ( $\text{CsF}$ ) likely to be?
- A  $-620 \text{ kJ mol}^{-1}$       B  $-720 \text{ kJ mol}^{-1}$       C  $-760 \text{ kJ mol}^{-1}$       D  $-800 \text{ kJ mol}^{-1}$
- 10 For which of the following would the difference between the experimental and theoretical lattice energies be greatest?
- A CaO      B CaS      C NaF      D NaCl
- 11 Which reaction has the most negative  $\Delta H$  value?
- A  $\text{LiF}_{(s)} \rightarrow \text{Li}^+_{(g)} + \text{F}^-_{(g)}$       B  $\text{Li}^+_{(g)} + \text{F}^-_{(g)} \rightarrow \text{LiF}_{(s)}$   
 C  $\text{NaCl}_{(s)} \rightarrow \text{Na}^+_{(g)} + \text{Cl}^-_{(g)}$       D  $\text{Na}^+_{(g)} + \text{Cl}^-_{(g)} \rightarrow \text{NaCl}_{(s)}$

## Extension Answers

Using lithium fluoride as the example, construct a Born-Haber cycle, labelling the cycle with the formulas and state symbols of the species present at each stage.

[6]

- (b) Given the following data (all in  $\text{kJ mol}^{-1}$ ) calculate the lattice enthalpy of lithium fluoride. [2]

$\Delta H^{\ominus}_{\text{formation}}$	lithium fluoride	-612
$\Delta H^{\ominus}_{\text{atomisation}}$	lithium	+161
$\Delta H^{\ominus}_{\text{atomisation}}$	fluorine	+79
1 <sup>st</sup> ionisation energy	lithium	+519
1 <sup>st</sup> electron affinity	fluorine	-348

.....

.....

$$-(-348) - (519) - (161) - (79) + (-612) = -1023 \text{ kJ mol}^{-1}$$

The signs between the brackets indicate if you are following the arrow in the diagram (in which case +) or going the opposite way to the arrow (in which case -)
